

# Heathy Woodland

Ecological Vegetation Classes (EVC) are the standard unit for classifying vegetation types in Victoria.

## EVC:48 Heathy Woodland | Kingston Status: Vulnerable

Spans a variety of geologies but is generally associated with nutrient-poor soils including deep uniform sands (aeolian or outwash) and Tertiary sand/clay which has been altered to form quartzite gravel. Eucalypt-dominated low woodland, lacking a secondary tree layer and generally supporting a diverse array of narrow or ericoid-leaved shrubs except where frequent fire has reduced this to a dense cover of bracken. Geophytes and annuals can be quite common but the ground cover is normally fairly sparse.
